About Me

Developer with a strong desire to grow and a proactive approach to solving complex problems. I am a fast learner who is passionate about understanding the full scope of software development. I am eager to apply my dedication and openness to feedback within a forward-thinking team.

Skills

Programming languages

- Java
- C#
- TypeScript
- JavaScript
- HTML5
- CSS3

Frameworks & Libraries

- SpringBoot
- .NET
- Angular
- React

Databases (RDBMS)

- MySQL
- MS SQL Server
- PostgreSQL

Other Tools

- Docker
- Android
- Scrum

Education

High School “Mihajlo Pupin” Bijeljina 2015 - 2019

Computer Technician

Faculty of Technical Sciences, Novi Sad 2019 - 2025

Software and information technologies

Experience

Elephant Solutions internship July-August 2021.

Developed a web shop application during an internship using Spring Boot for the backend and React for the frontend. The application supports basic e-commerce functionalities such as product listing, user authentication, and order management, with data stored in a relational database. Worked in a team environment and followed basic best practices in web development.

Experience

Bachelor's thesis project

Developed a ticketing service application as a bachelor's thesis, built with Spring Boot (backend) and Angular (frontend). The application enables users to see all information about football club, browse football matches, purchase tickets, and complete payments via PayPal integration. The system is based on a RESTful architecture with a relational database and focuses on secure transactions and structured application design.

Student project

Participated in a study program–wide e-government application project, where teams of two students developed individual modules that communicated with other teams via Docker containers. My responsibility was to implement the Statistics Department module, focusing on data aggregation and reporting. The project emphasized teamwork, inter-service communication, and containerized development.

Student project

Developed a hospital management desktop application using .NET (WPF). The system enables full CRUD operations for managing doctors, patients, medical records, examinations, and appointments. The application supports efficient data handling and provides a user-friendly desktop interface for daily hospital operations.

Student project

Developed a mobile application based on the "Slagalica" quiz show using Java and Android Studio. The system features complex game logic for word puzzles and mathematical challenges, supporting real-time input validation and scoring. The application implements efficient state management for game cycles and provides a responsive, user-friendly interface for a seamless mobile experience.

Finished project

Developed a booking service application designed for businesses that require appointment scheduling (such as hair salons and similar service-based industries). The system allows users to view available time slots and make reservations, while an admin panel provides full visibility and management of all appointments. The project focuses on clean and structured application design.

Current project

A high-performance Football Club Management Platform built with React, Vite, and Firebase, designed to enhance fan engagement and streamline club operations. The system features a real-time Live Match Commentary engine, a dynamic Roster management system, and automated League Standings and Fixtures tracking. A secure Admin Dashboard provides full visibility and management of club data, with the entire application optimized for speed and deployed via Vercel.
